

Operator Functions — Analytics & Monitoring

CleanStreet AI — Functional Requirements (P01)

#	Function	Description	Acceptance Condition
1	Hotspot Detection	The system automatically identifies locations with a high frequency of repeated reports within a defined time period, displaying them visually on the operations map as areas requiring urgent attention.	A location is automatically flagged as a "Hotspot" when it receives 5 or more reports within a 30-day period. Hotspots are displayed on the map with a distinct marker/color, along with a report count.
2	Recurring Reports	The system links multiple reports submitted about the same location or issue instead of treating them as separate entries, grouping them under a single recurring problem.	Reports within a 50-meter radius submitted within 7 days of each other are automatically grouped under one primary report, with a visible "recurrence count" indicator.
3	Area Burden	The system calculates and displays the load (number of open reports) per geographic area, helping supervisors distribute cleaning teams fairly.	The dashboard displays a ranked list of areas by number of open reports, updating automatically whenever a report is created or closed.
4	Team Workload	The system displays the number of tasks currently assigned to each cleaning team, allowing supervisors to balance new report assignments.	The dashboard shows, per team: number of open tasks, number of tasks completed today, and team availability status, updated in real time as task status changes.
5	Open Tasks	The system displays a unified list of all unresolved reports, sorted by priority, serving as a quick reference for the operations team.	The "Open Tasks" list shows all reports with status (Open / In Progress), automatically sorted with the oldest and highest-priority reports appearing first. Closed reports are automatically excluded.
6	SLA Ageing	The system tracks the elapsed time since each report was received and visually flags reports approaching or exceeding the allowed response time (SLA).	A report is marked yellow (warning) after remaining open for more than 24 hours, and red (overdue) after 48 hours. A time counter is displayed next to each report.

Note: The numeric thresholds above (5 reports, 24/48 hours, etc.) are initial working assumptions and can be adjusted based on real usage data after launch.
